

Rabbit Control

Maraetōtara Dunes June/July 2017

Dear Resident,

We have been undertaking a rabbit control operation in your area over the last month. This has been very successful however there is a residual population that requires more work.

This is to notify you that the rabbit control operation in the sand dunes between the **Maraetōtara Stream** and **Te Akau Street** will continue, recommencing **Thursday 22 June 2017** through to **Thursday 20 July 2017**.

METHODS OF CONTROL WILL BE:

- Fumigant pesticide **Magnesium Phosphide** (Magtoxin). This will be laid by hand into active rabbit burrows during daylight hours.
- **Magtoxin** is a broad spectrum fumigant which degrades very quickly, with little risk to non-target species and humans.
- Warning signs will be erected at 100m intervals along the beach, as well as at major accessways.

Please follow the signage directions.

- **Avoid rabbit burrows**
- **Keep dogs on a leash when walking through the sand dunes**
- **Watch children at all times**
- **Do not consume wildlife from this area.**
